

# Building your own bird crown

1: Locate a small scrap of fence material

2: Cut fencing so that you have a single spine with numerous wires coming off it like a fringe or eyelash.

3. Remove part of the fringe to create a 6-8 inch tail

4. Wrap the remaining fringe into a crown approximately 10-15 cm in diameter so that it will fit in the opening of the funnel. The tail should be situated in a way to be inserted down the funnel and into the tube.
